## 1 PROBLEM

- (Prob 3.6) Find the probability distribution of  
 (i) number of heads in two tosses of a coin.  
 (ii) number of tails in the simultaneous tosses of three coins.  
 (iii) number of heads in four tosses of a coin.

## 2 SOLUTION

Let  $X_i \in \{0, 1\}$  represent the  $i^{th}$  coin where 1 denotes the coin giving outcome as head. Then,  $X_i$  has a Bernoulli distribution with parameter

$$p = \frac{1}{2} \quad (2.0.1)$$

Let

$$X = \sum_{i=1}^n X_i \quad (2.0.2)$$

where  $n$  is the total number of coins tossed. Then  $X$  has a Binomial Distribution. Then for

$$p_{X_i}(n) \stackrel{Z}{=} P_{X_i}(z) \quad (2.0.3)$$

yielding

$$P_{X_i}(z) = 1 - p + pz^{-1} \quad (2.0.4)$$

with using the fact that  $X_i$  are i.i.d.,

$$\begin{aligned} P_X(z) &= (1 - p + pz^{-1})^n \\ &= \sum_{k=0}^n {}^nC_k p^k (1-p)^{n-k} z^{-k} \end{aligned} \quad (2.0.5)$$

$$p_X(k) = \begin{cases} {}^nC_k p^k (1-p)^{n-k} & 0 \leq k \leq n \\ 0 & \text{otherwise} \end{cases} \quad (2.0.6)$$

## 2.1 (i)

Here we are seeing outcome of two tosses of a coin. We can say it as simultaneous tossing two coins. So, we get,

$$n = 2 \quad (2.1.1)$$

Now we obtain probability distribution of number of heads of two coins from (2.0.6),

$$p_X(k) = \begin{cases} {}^2C_k (\frac{1}{2})^k (1 - \frac{1}{2})^{2-k} & 0 \leq k \leq 2 \\ 0 & \text{otherwise} \end{cases} \quad (2.1.2)$$

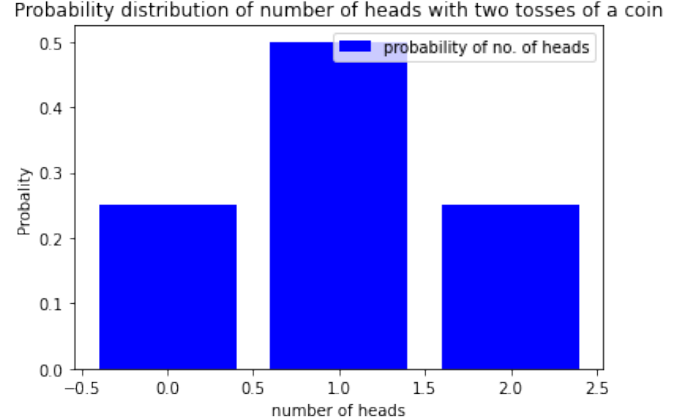

Fig. 0: Plot of probability distribution of two tossed coins

## 2.2 (ii)

With respect to tails the parameter would change to

$$q = 1 - p = \frac{1}{2} \quad (2.2.1)$$

and there will be a small change in binomial distribution (2.0.6) and we get binomial distribution for

tails as,

$$p_{1-X}(k) = \begin{cases} {}^nC_k q^k (1-q)^{n-k} & 0 \leq k \leq n \\ 0 & \text{otherwise} \end{cases} \quad (2.2.2)$$

Here we are seeing outcome of simultaneous tosses of three coin. So, we get,

$$n = 3 \quad (2.2.3)$$

Now we obtain probability distribution of number of tails of three coins from (2.2.2),

$$p_{1-X}(k) = \begin{cases} {}^3C_k (\frac{1}{2})^k (1 - \frac{1}{2})^{3-k} & 0 \leq k \leq 3 \\ 0 & \text{otherwise} \end{cases}$$

$$p_{1-X}(k) = \begin{cases} {}^3C_k (\frac{1}{2})^2 & \text{if } 0 \leq k \leq 3 \\ 0 & \text{otherwise} \end{cases} \quad (2.2.4)$$

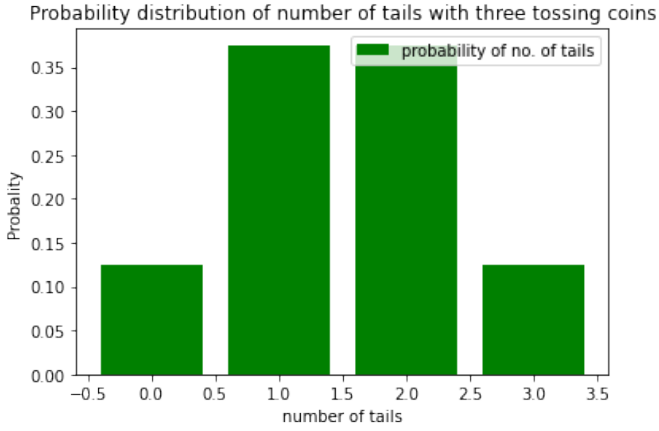

Fig. 0: Plot of probability distribution of no of tails with three tossed coins

### 2.3 (iii)

Here we are seeing outcome of four tosses of a coin. We can say it as simultaneous tossing four coins. So, we get,

$$n = 4 \quad (2.3.1)$$

Now we obtain probability distribution of number of heads of two coins from (2.0.6),

$$p_X(k) = \begin{cases} {}^4C_k (\frac{1}{2})^k (1 - \frac{1}{2})^{4-k} & 0 \leq k \leq 4 \\ 0 & \text{otherwise} \end{cases}$$

$$p_X(k) = \begin{cases} {}^4C_k (\frac{1}{2})^4 & \text{if } 0 \leq k \leq 4 \\ 0 & \text{otherwise} \end{cases} \quad (2.3.2)$$
